

Production Portfolio,

Web Audio & Resilient Events

Submission evidence for Homework 1, Homework 2, and Homework 3.

REPOSITORY - all three assignments

github.com/Vipersolowkey/web-foundations-hw123

Included deliverables

- HW1 - semantic production portfolio, accessible dialog, keyboard focus and CSP.
- HW2 - data-sound contract, polyphonic Web Audio, repeat gate, FIFO beat recorder.
- HW3 - UTC countdown, RSVP state machine, input checks, double-submit prevention.
- AI_FAILURE_AUDIT.md - three detected AI defects, diagnosis, fixes, and verification.

AI conversation link

Add your ChatGPT/Codex shared-conversation URL before submitting.

Reason: a share URL is created only by the chat-account owner; it cannot be generated from this workspace.

Prompt log and failure audit are attached on pages 2-3; add your Share URL before upload.

AI assistance prompt log

Reconstructed prompts for submission documentation - not a verbatim chat export.

01 HW1 - portfolio foundation

Build a one-page production portfolio with semantic HTML, external CSS, modular JavaScript, native controls, a skip link, visible keyboard focus, three project cards, and an accessible case-study modal. Do not use inline handlers or runtime dependencies, and keep it responsive from 375px upward.

02 HW1 - accessibility and security review

Review the portfolio for WCAG 2.2 AA. Make the dialog announce its title and description, move focus into it, trap Tab and Shift+Tab, restore focus to its opener, and recommend a strict CSP that works without inline JavaScript. Identify reduced-motion and responsiveness checks.

03 HW2 - contract-first drum kit

Design the data contract before JavaScript: each native drum button needs data-sound and a unique lowercase data-key. Create a polyphonic Web Audio engine, support pointer and keyboard input, prevent held-key repeats, and describe a small testable recorder API that stores timestamped beats in FIFO order.

AI assistance prompt log

Reconstructed prompts for submission documentation - not a verbatim chat export.

04 HW3 - resilient event form

Implement a countdown from an explicit ISO 8601 UTC timestamp, not a browser-local date string. Model the RSVP flow as idle, submitting, success, and error; validate input, prevent double submits, and write status messages through `textContent` rather than `innerHTML`. Keep tests deterministic.

05 AI failure-mode audit

Critically review generated code and document three plausible AI defects: time-zone parsing, unsafe DOM rendering, and keyboard auto-repeat. For each defect, provide a diagnosis method, a refactored solution, and a concrete verification step. Keep the report suitable for a live defense and do not invent external integrations.

Product evidence - HW1

Semantic project portfolio and accessible case-study controls.

Work Drum kit Events

WEB APPLICATION DEVELOPMENT

Built with intent. *Tested in the details.*

A compact portfolio showing accessible interfaces,
browser audio, and resilient event interactions.
